and each year adds more than double to its value. In addition, the
average annual growth rate of the market is 10 percent, so the value of
the house will increase by 10 percent each year. This is a good
example of how compound interest (which is what it is) works. If you
put \$100 in a bank account that paid 10 percent interest, after one
year you would have \$110. After two years, you would have
\$121. After three years, you would have \$133. After four years,
you would have \$146. After five years, you would have \$161.
After ten years, you would have \$259.
